

Model Oasis flower pot Designer Ann Kristin Einarsen

Each of these self-watering terracotta planters is comprised of interlocking containers, giving them a stable base and an integrated water reservoir. Available in two sizes, the planters can contain a variety of plants, shrubs, or even small trees. The water reservoir fills from the side, through an opening large enough to be refilled by a waterspout or hose nozzle. The self-watering function is activated when the upper containers absorb water from the bases below them.
